Get-ResourceCostDetails

Purpose:
Collect usage and cost data for resources of given resource type in Azure in given subscriptions.
Resources which do not generate any cost or are usually not of interest as their cost does not depend on usage (e.g. VM disks) are skipped, but can be included if they are listed in the resource types.
Data is usually output as PSCustomObjects, but can also be output to a (set of) CSV files.

Usage:
```
Get-ResourceCostDetails -subscriptionFilter <subscription>[,<subscription>]
[-resourceTypes <type>[,<type>]] [-excludeTypes <type>[,<type>]]
[-billingPeriod <billingperiod>] [-noUnits] [-showZeroCostItems]
[-outFile <filename> [-delimiter <character>]] [-WhatIf]
Get-ResourceCostDetails [-help]
```

Parameters:

-subscriptionFilter	Mandatory. Single filter or comma-separated list of filters. All subscriptions whose name contain the filter expression will be analysed.
-resourceTypes	Single filter or comma-separated list of filters. Only resources with matching types will be analysed. If '*' is given as filter, all resource types will be evaluated, except those which are excluded by default and except those listed with the excludeTypes.
-excludeTypes	Single resource type or comma-separated list of types, evaluation of these types will be skipped. Some types will be excluded by default unless specified in the resourceTypes parameter.
-billingPeriod	Collect cost for given billing period, format is 'yyyyMMdd',default is the last month.
-noUnits	Usually the first object returned is a list of units & scales, as the metrics come in 1s, 10000s, or so. This switch will omit the units object, so that only the actual metrics are output. This is useful if one single resource type is evaluated and the output is piped into another function.
-showZeroCostItems	Display cost items that are zero. Normally, these items are omitted from the output.
-outFile	Write output to a set of CSV files. Without this switch, results are written to standard output as objects. Since the results have a different format for each resource type, results are not written to a single CSV file, but to separate files, one for each resource type. For each file, the resource type will be inserted into the name before the final dot.
-delimiter	Separator character for the CSV file. Default is the list separator for the current culture.
-WhatIf	Don't evaluate costs but show a list of resources and resource types which would be evaluated.

Get-AzurePrice

Purpose:
Lists the price for a specified VM or managed disk

Usage:
```
Get-AzurePrice -VMType <vmtype> [-Reservation <reservation>] [-AHB] [-Currency <currency>]
Get-AzurePrice -DiskType <disktype> [-Redundancy <redundancy>] [-Currency <currency>]

    Get-AzurePrice -VMType [...] displays estimated monthly fee for a given VM type
    <vmtype>          must be written exactly as in the price table, including proper
                      capitalization. The space may be replaced by an underscore,
                      e.g. use "D4s v4" or "D4s_v5"
    <reservation>     is 0, 1, or 3 (years). If omitted, all three values will be reported,
                      separated by semicolons
    <currency> can be any valid three-letter currency code, default value is EUR

    -AHB              if this switch is given, prices are given without Windows license (i.e.
                      using Azure Hybrid Benefit)

Get-AzurePrice -DiskType [...] displays estimated monthly fee for a given disk type
    <disktype>        must be written exactly as in the price table, including proper
                      capitalization, e.g. "E10" or "S20"
    <redundancy>      is either LRS or ZRS, default is LRS
    <currency>        can be any valid three-letter currency code, default value is EUR
```

Get-ConnectedNICs

Purpose:
List network interfaces in given subscriptions with IP address, VNet name, network address and DNS record, also tests whether NIC is responding to pings

Usage:
```
Get-ConnectedNICs [-subscriptionFilter <filterexpression>] [-outFile <outfilename>] [-noPing]
    -subscriptionFilter   mandatory parameter, list NICs in subscriptions matching the filter
    -outFile              writes results to a semicolon-separated CSV format if this parameter
                          is given
    -noPing               skips testing whether the NIC is responding to a ping
```

Get-FileAccesses

Purpose:
provides count and size statistics about file extensions and ages on file storages

Usage:
```
Get-FileAccesses -serverName <servername> [-shareName <sharename>] [-onAccess] [-noAges]
[-noExtensions] [-priority (BelowNormal | Normal | AboveNormal | High | Realtime)]
    -serverName           Mandatory, evaluates data on given share(s) of <servername>
    -shareName            Analyzes files on the given share.
                          If omitted, analyzes data on all non-hidden shares of the given
                          server.
    -onAccess             Uses lastAccess for age calculation.
                          If omitted, uses lastWrite for age calculation
    -noAges               Ignores file age, lists by extensions only (if -noExtensions is not
                          given)
    -noExtensions         Ignores extensions, lists by age only (if -noAge is not given)
                          If BOTH -no... switches are given, script only returns total file
                          count and size
    -priority             Starts process with given priority. Use with care.
                          Possible values are BelowNormal | Normal | AboveNormal | High |
                          Realtime

Examples:
to list file count and size by age, based on last accessed date'
Get-FileAccesses -ServerName myserver -ShareName myshare -onAccess -noExtensions

to see all properties in table format, use ft -Property *
Get-FileAccesses -ServerName myserver -ShareName myshare | ft -Property *
```

Get-NSGRules

Purpose:
Lists the NSG rules in the given subscriptions in a summarized or detailed way

Usage:
```
Get-NSGRules -subscriptionFilter <filterexpression> [-details | -briefDetails]
    -subscriptionfilter   mandatory parameter, list NSGs in subscriptions matching the filter
    -details              list all rules in order of their priority
    -briefDetails         list every rule, but fewer details
                          if neither "details" switch is present, then all open ports are
                          listed, regardless of the actual source and target networks.
                          Since this mixes rules, it gives you an overview of ports but no
                          reliable information about security
```

Get-PrinterQueues

Purpose:
Lists all printer queues on all computers matching the filter.
The output will be for the each printer on the matching computer(s),
name of computer, printer, driver, and printer IP address.

Usage:

```
Get-PrinterQueues -Filter <filter> [-details] [-ping] [-outFile <outfilename>]
 -Filter
           name(s) of computer(s) whose queues shall be displayed. Filter may contain
           wildcards
 -details  Give additional details for each printer: name of shared printer, location,
           comment, and port name
 -ping     will try to ping each printer and output an additional field 'IsLive'
 -outFile  if given, exports result into a semicolon-separated CSV file
```

Get-VirtualMachineInfo

Purpose:
Lists the VMs, their SKU and their disks

Usage:

```
Get-VirtualMachineInfos -subscriptionFilter <filterexpression>
[-disks [-asString | -aggregatedString]] [-ipAddresses] [-ping]
[-outFile <filename> [-separator <separator>]]
Get-VirtualMachineInfos -subscriptionFilter <filterexpression> -all
[-asString | -aggregatedString] [-outFile <filename> [-separator <separator>]]

Returns a list of all subscriptions, virtual machines, their SKU, IP addresses, and SKUs of
                  attached disks in subscriptions matching the filter
-all              includes -disks, -ipAddresses, -ping
-disks            show OS and data disk SKUs
-asString         shows the disks in string format
-aggregatedString shows the disks in an aggregated string format
-ipAddresses      show IP address(es)
-ping             ping VM to see whether it is live
-outFile          if given, exports result into a CSV file
-separator        separator for items in CSV file, default is semicolon
```

Get-VirtualNetworks

Purpose:
Lists all virtual networks, subnets, IP addresses and -ranges for the specified subscription(s)

Usage:

```
Get-VirtualNetworks -subscriptionFilter <filterexpression> [-outFile <outfilename>]
[-excludeSubnets]

-subscriptionFilter    mandatory. Lists networks in subscriptions matching the filter
-outFile               will write output into semicolon-separated CSV file,
                       otherwise output is a list of objects
-excludeSubnets        will only list VNets, not subnets
```

Get-AzureResourceData

Purpose:
Returns a list of resources of selected type(s) in selected subscription(s), along with some properties and metrics.

Usage:

```
Get-AzureResourceData -subscriptionFilter <filterexpression> [-VMs] [-SqlServer] [-DbAas]
                     [-Storage] [-ResourceList [-details] [-lastHours <hours>]
                     [-billingPeriod <billingperiod>]] [-outFile <filename> [-separator]]
Get-AzureResourceData -subscriptionFilter <filterexpression> [-all] ...

Parameters:
   -subscriptionFilter  Single filter or comma-separated list of filters. All subscriptions
                        whose name matches the filter expression will be analysed.
   -VMs                 Show VMs and their properties
   -SqlServer           Show SQL server VM properties
   -DbAas               Show Azure SQL (databases aaS)
   -Storage             Show storage accounts
   -Snapshot            Show snapshots
   -all                 All of the above switches
   -lastHours           collect metrics within the given time period, default is 24 hours
```

```
   -ResourceList        Show count of resource types in subscription
   -billingPeriod       Collect resource cost for given billing period, default is the last
                        month. Note that there may be no data available for the given billing
                        period.
   -details             Show list of resources in subscription
   -outFile             Export result into a CSV file rather than on the console
                        NOTE: separate files will be created for different resource types.
                        Two characters will be added to the file names to make them different.
   -separator           Separator for items in CSV file, default is semicolon
   -WhatIf              Just display the names of the subscriptions which would be analysed

    NOTE: you may adjust this script e.g. to add or remove metrics. These parts of the code
          are marked with # >>>>> and # <<<<<.
          Refer to the comments inside the code for further information.
```

Get-StorageAccountCostDetails

Purpose:
Get all cost and usage metrics from the billing details for storage accounts in selected subscription(s). Metrics which are zero for all accounts will be omitted from output. Field names will reflect the name of the billing metric and the units (e.g. 1/hour or 10K).

Usage:

```
Get-StorageAccountCostDetails -subscriptionFilter <filter>[,<filter>]
                              [-billingPeriod <billingperiod>]
```

Parameters:

```
-subscriptionFilter   single filter or comma-separated list of filters. All
                      subscriptions whose name contain the filter expression
                      will be analysed.
-billingPeriod        collect cost for given billing period,
                      format is 'yyyyMMdd', default is the last month
```
